- After vehicle passage, sensors signal to close the gate.

Ladder Logic Example:

- Inputs:
- `RFID\_OK` (RFID reader confirms authorized card)

- `Entry\_Sensor` (vehicle detected at entry point)
- Outputs:
- `Gate\_Open` (activates barrier motor)
- Logic:
- If `RFID\_OK` AND `Entry\_Sensor` are true, then `Gate\_Open` activates.
- After a delay, `Gate\_Close` signal resets.

Additional Considerations:

- Time delays to prevent premature closing
- Handling invalid access attempts with alarms

Implementation with Ladder Logic:

- Each parking spot has a sensor input indicating occupied or free status.
- A central PLC aggregates data to maintain real-time availability.

Sample Logic:

- For each parking space:
- If sensor detects vehicle, set corresponding `Space\_Status` to 'Occupied'.
- Else, set to 'Available'.
- A counter tracks total available spaces by counting 'Available' statuses.

Display Integration:

- The system updates digital signage or LED indicators to guide drivers:
- Green: Available
