Sample Problem Breakdown: Assembly Language Solution Example

Problem Statement: Write an assembly program to compute the sum of an array of integers.

Solution Approach:

- Initialize the sum register to zero.
- Set the base address of the array.
- Loop through array elements:
 - Load each element into a register.
 - Add it to the sum register.

- After the loop, store or display the sum.

Sample Assembly Code (Generic):

...

MOV CX, ARRAY_SIZE ; Loop counter

MOV SI, OFFSET array ; Base address of the array

MOV AX, 0 ; Initialize sum to zero

LOOP_START:

MOV DX, [SI] ; Load current array element

ADD AX, DX ; Add element to sum

ADD SI, 2 ; Move to next element (assuming 16-bit integers)

LOOP LOOP_START ; Decrement CX and repeat if not zero

; Result in AX

...

Explanation:

- Registers used:
- `CX` as loop counter
- `SI` as source index (pointer to array)
- `AX` as accumulator for sum
- The loop loads each array element, adds it, and advances the pointer.
- After the loop, `AX` contains the total sum.

Test Case and Output:

- Input array: `[5, 10, 15, 20]`
- Expected sum: `50`

Notes:

- The code can be adapted for different data types and array sizes.
