Understanding the mammalian ear requires a step-by-step exploration of its components:

- Outer Ear (External Ear)
- Middle Ear
- Inner Ear

Each segment contains key structures that work in concert to perform the ear's functions.

The Outer Ear

Components of the Outer Ear

The outer ear captures sound waves and funnels them toward the middle ear. Its main structures include:

- Pinna (Auricle): The visible part of the ear, made of cartilage and skin, responsible for collecting sound and aiding in sound localization.
- Auditory Canal (External Acoustic Meatus): A tube that directs sound waves inward; lined with ceruminous glands that produce earwax, protecting the ear canal.
- Tympanic Membrane (Eardrum): A thin membrane that vibrates in response to sound waves, converting acoustic energy into mechanical vibrations.
