3. Stem

In Pistia, the stem is very reduced or absent, as it primarily functions through its rosette of leaves.

- **Structure:** Usually subterranean or very short, with no prominent stem above water.
- **Function:** Provides support and some internal transport, but mainly the plant relies on leaves and roots.

4. Reproductive Structures

Pistia reproduces both sexually and asexually.

- **Flowers:** Small, spadix-type flowers borne on a spadix enclosed within a spathe.
- **Inflorescence:** The flowering structure appears above water, facilitating pollination.

Components of the Labelled Diagram of Gnetum

A typical labelled diagram of Gnetum includes several key parts, each with specific structural and functional attributes. Below, we dissect each component in detail.

1. Stem

The stem of Gnetum is usually slender, woody, and sometimes climbing, with a prominent central pith. It provides structural support and houses vascular tissues responsible for transporting water, nutrients, and food.

Features:

- Vascular bundles: Arranged in a complex ring, enabling efficient conduction.
- Lenticels: Small openings on the stem surface for gaseous exchange.

- Outer cortex: Composed of parenchyma cells that store food.

Significance: The stem's structure supports the plant's growth form, whether as a climbing vine or shrub.

2. Leaves

Gnetum leaves are broad, leathery, and evergreen, which distinguishes them from many gymnosperms. They are arranged alternately along the stem.

Features:

- Shape: Usually ovate or lanceolate.
- Venation: Net-like (reticulate venation), similar to angiosperms.
- Petiole: Attaches the leaf blade to the stem.

Function: Photosynthesis, transpiration, and gas exchange are primary functions facilitated by the leaves.
