Fundamentals of Enzymology

Understanding Enzymes: Biological Catalysts

Enzymes are specialized proteins that catalyze biochemical reactions by lowering activation energy, thereby increasing reaction rates without being consumed in the process. Their catalytic proficiency is attributed to their complex three-dimensional structures, which facilitate substrate binding and transition state stabilization.

Key characteristics of enzymes include:

- Specificity: Enzymes exhibit substrate specificity, often classified into absolute, group, linkage,

- Non-competitive: Bind elsewhere, altering enzyme conformation.
- Uncompetitive: Bind only to the enzyme-substrate complex.

Enzyme Cofactors and Coenzymes

Many enzymes require non-protein molecules for activity:

- Cofactors: Metal ions like Mg^{2+} , Zn^{2+} , or Fe^{2+} .
- Coenzymes: Organic molecules such as NAD⁺, FAD, or coenzyme A.

These assist in stabilizing transition states or participating directly in catalysis.

Advances in Enzyme Technology
