Once your environment is ready, you can start coding. Here's a step-by-step guide to writing your first program.

Creating a "Hello, World!" Program

- Open Your IDE/App:

- Create a New File:
- Usually, there?s an option like "New File" or "+" button.
- Write the Code:

```
``python  
  
print("Hello, World!")  
  
```
```

- Save the File:
- Name it `hello.py` or any preferred name.
- Run the Program:
- Tap the run button or select 'Run' from the menu.
- See the Output:
- Your screen should display: `Hello, World!`

## Understanding the Code

- `print()` is a built-in Python function that outputs text to the console.
- The string `"Hello, World!"` is what appears on the screen.

## Basic Concepts in Python for Beginners

Before progressing to more complex programs, it?s important to understand some fundamental

concepts.

## Variables and Data Types

Variables store information that can be used and manipulated throughout your program.

Common Data Types:

- Integers: Whole numbers (e.g., 1, 42)
- Floats: Decimal numbers (e.g., 3.14, 0.001)
- Strings: Text data (e.g., "Python", 'Hello')
- Booleans: True or False values

Example:

```
```python
```

```
name = "Alice"
```

```
age = 25
```

```
height = 5.6
```

```
is_student = True
```

```
```
```

## Operators and Expressions

Operators perform operations on variables and values:

| Operator | Description | Example |
|----------|-------------|---------|
|----------|-------------|---------|

| Operator | Description | Example |
|----------|-------------|---------|
|----------|-------------|---------|

|   |          |                      |
|---|----------|----------------------|
| + | Addition | <code>`a + b`</code> |
|---|----------|----------------------|

|   |             |                      |
|---|-------------|----------------------|
| - | Subtraction | <code>`a - b`</code> |
|---|-------------|----------------------|

|   |                |                      |
|---|----------------|----------------------|
| * | Multiplication | <code>`a * b`</code> |
|---|----------------|----------------------|

| / | Division | `a / b` |

| % | Modulus | `a % b` |

## Control Structures

Control flow determines the order in which code executes.

Conditional Statements:

```
```python
```

```
if age >= 18:
```

```
    print("Adult")
```

```
else:
```

```
    print("Minor")
```

```
```
```

Loops:

```
```python
```

```
for i in range(5):
```

```
    print(i)
```

```
```
```

## Developing Your First Projects on a Tablet

Once familiar with basic syntax, you can start creating simple projects to reinforce your learning.

### Number Guessing Game

Objective: Write a program that randomly selects a number, and the user tries to guess it.

Sample Implementation:

```
```python

import random

secret_number = random.randint(1, 100)

print("Guess the number between 1 and 100!")

while True:

    guess = int(input("Your guess: "))

    if guess == secret_number:

        print("Congratulations! You guessed it!")

        break

    elif guess

    print("Too low. Try again.")

    else:

        print("Too high. Try again.")

```
```

Note: Depending on your app, `input()` may require a different approach, such as using text input fields.

## Simple Calculator

Create a program that performs basic arithmetic:

```
```python

num1 = float(input("Enter first number: "))

operator = input("Enter operator (+, -, , /): ")

num2 = float(input("Enter second number: "))
```

```
if operator == '+':

    result = num1 + num2

elif operator == '-':

    result = num1 - num2

elif operator == "*":

    result = num1 * num2

elif operator == '/':

    if num2 != 0:

        result = num1 / num2

    else:

        result = "Error: Division by zero!"

else:

    result = "Invalid operator."

print("Result:", result)

'''
```
