Question:

Explain how the process of photosynthesis occurs in green plants.

Step 1: Understand the Question

- Command word: "Explain" (requires detailed description).
- Focus: Photosynthesis process in green plants.

Step 2: Planning

- Key points to cover:
- Role of chlorophyll and chloroplasts.
- The raw materials: carbon dioxide and water.
- The process: light absorption, conversion to chemical energy.
- The products: glucose and oxygen.
- The overall equation.

Step 3: Construct the Answer

"Photosynthesis in green plants occurs primarily in the chloroplasts found within leaf cells, which contain the pigment chlorophyll. When sunlight strikes the chlorophyll, it absorbs light energy, which excites electrons and initiates a series of reactions known as the light-dependent reactions. During these reactions, energy from light is converted into chemical energy in the form of ATP and NADPH."

"The plant takes in carbon dioxide from the atmosphere through tiny pores called stomata, and water is absorbed from the soil via the roots and transported to the leaves. In the light-independent reactions (Calvin cycle), the chemical energy produced earlier is used to convert carbon dioxide into glucose, a form of chemical energy that the plant can store and use for growth."

"Meanwhile, oxygen is produced as a byproduct when water molecules are split during the

light-dependent reactions. The overall balanced equation for photosynthesis can be written as:

This detailed explanation covers the process comprehensively, uses correct terminology, and presents information logically.
